Section 1: System Architecture Specification

The ingestion subsystem parses multi-page documents and converts raw streams into clean text blocks. Natural language processing pipelines split documents into discrete syntactic sentences for analysis. Dense vector embeddings capture rich semantic relationships across high-dimensional latent space.

This document establishes the official specifications and contractual requirements. All authorized personnel must adhere strictly to these operational guidelines. Failure to comply may result in audit findings and security reviews.

Section 2: System Architecture Specification

Distributed vector indexing accelerates approximate nearest neighbor retrieval across massive corpora. Cross-encoder re-ranking models compute precise relevance scores to eliminate hallucinations. High availability clusters ensure sub-second response latency for enterprise compliance auditing.
